

OMNIBOT™ INTRODUCING FINTECH'S FIRST...

Omnibot is a first-of-its-kind networking device that allows capital markets infrastructure consumers to integrate L2/L3 network switching into a single application-aware appliance. Mission-critical trading applications such as pre-trade risk management, data delivery and latency measurement are combined into a single device.

Omnibot is a platform upon which HPR is building the next generation of electronic trading infrastructure that blends the know-how of a leading financial technology firm with the technological DNA required to build world-class IaaS services. This technology affords HPR's clients the edge they need to compete with the incumbent infrastructure providers.
